

Project Summary: Hosting a Static Website on Amazon S3

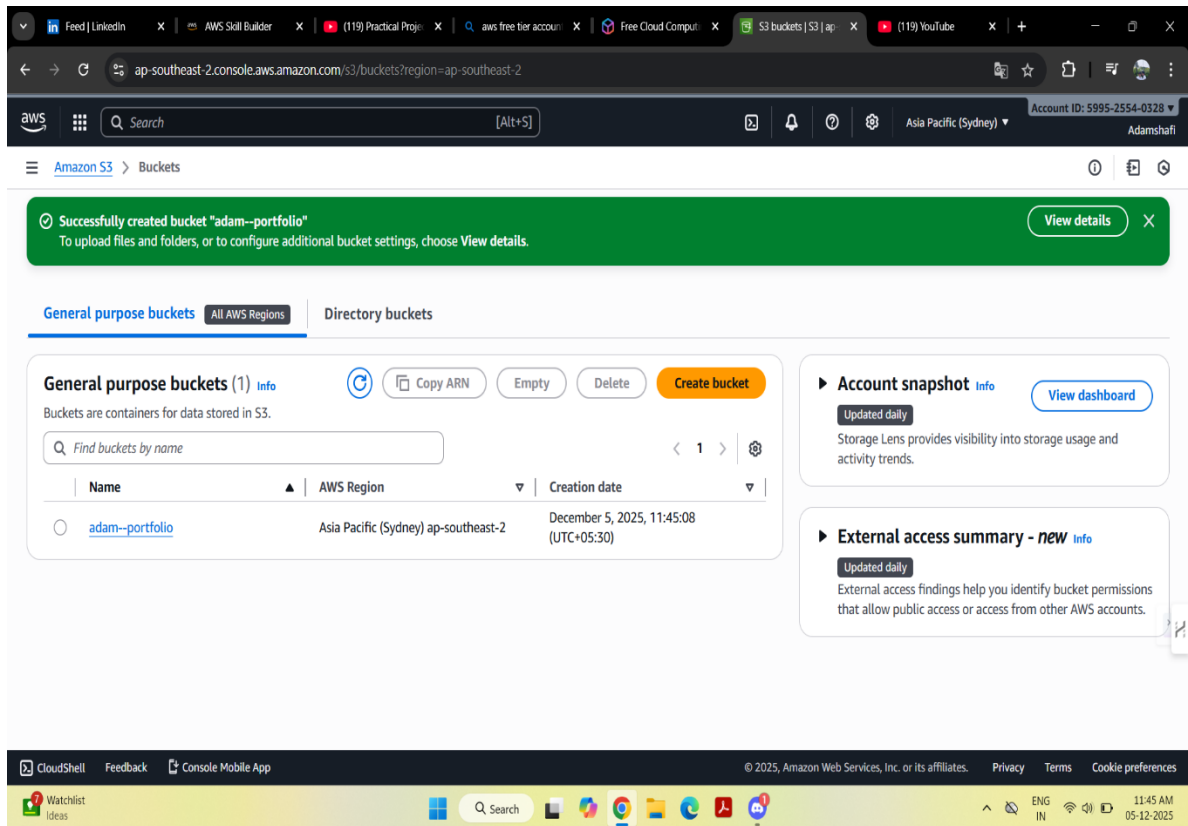

This project demonstrates the process of hosting a static portfolio website using **Amazon Simple Storage Service (S3)**, which is a common and cost-effective method for serving static content on the web. ☁ ☁ ☁

1. Create an S3 Bucket

- **Action:** Navigated to Amazon S3 and created a new bucket.

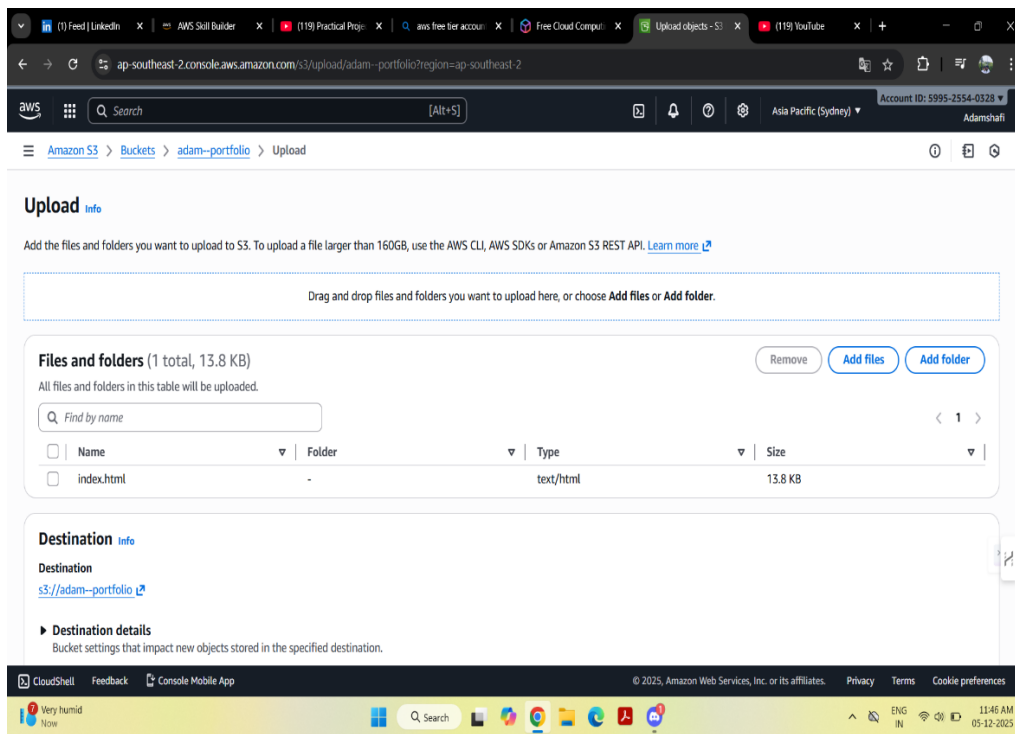

Shows the Amazon S3 service landing page.

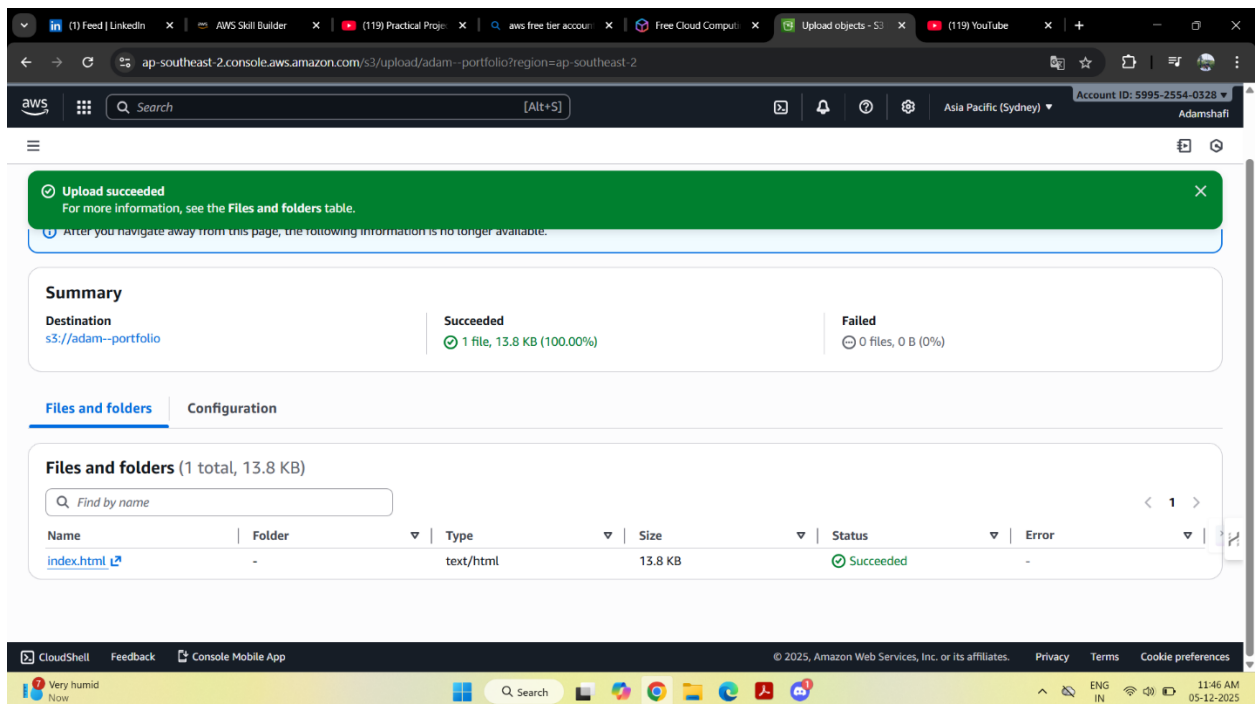

Confirms the successful creation of a General purpose bucket named **adam-portfolio** in the Asia Pacific (Sydney) region

2. Upload the Website Files

Action: Uploaded the static website files to the newly created S3 bucket.

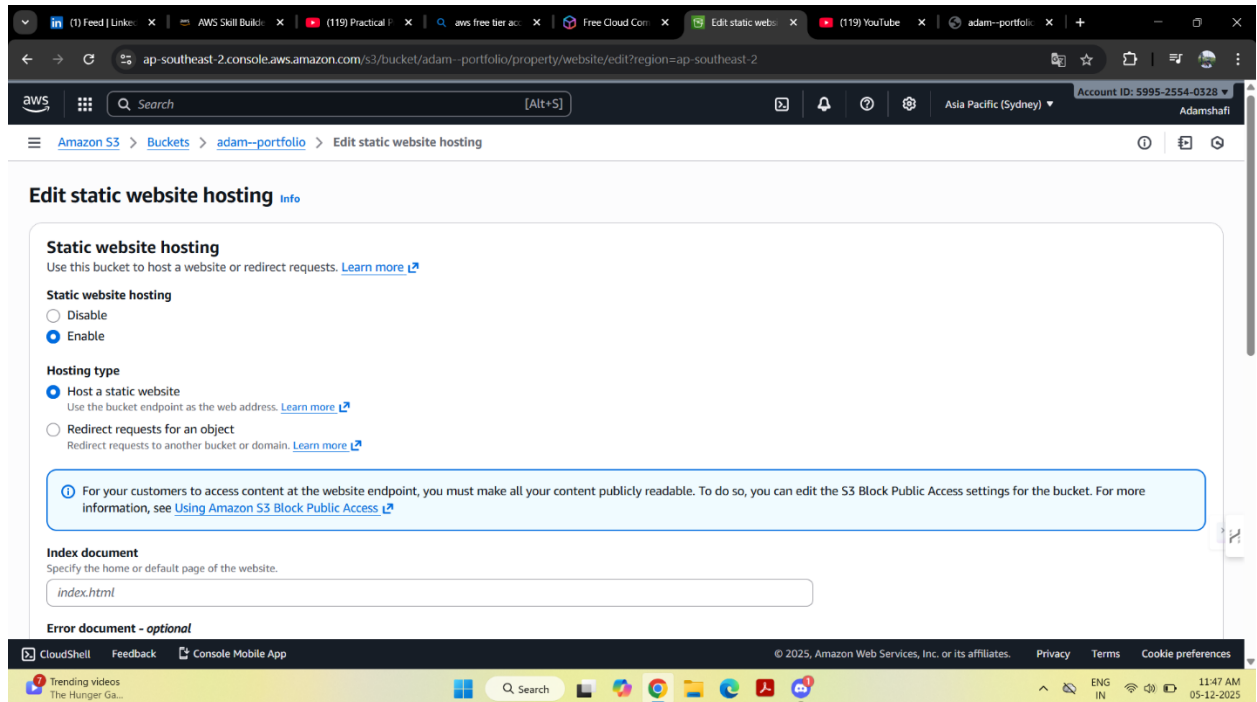

? Shows the upload page, confirming the index.html file is selected for upload to the adam-portfolio bucket.

Confirms the successful upload of the **index.html** file.

3. Enable Static Website Hosting

- **Action:** Configured the S3 bucket to function as a web server by enabling Static Website Hosting.

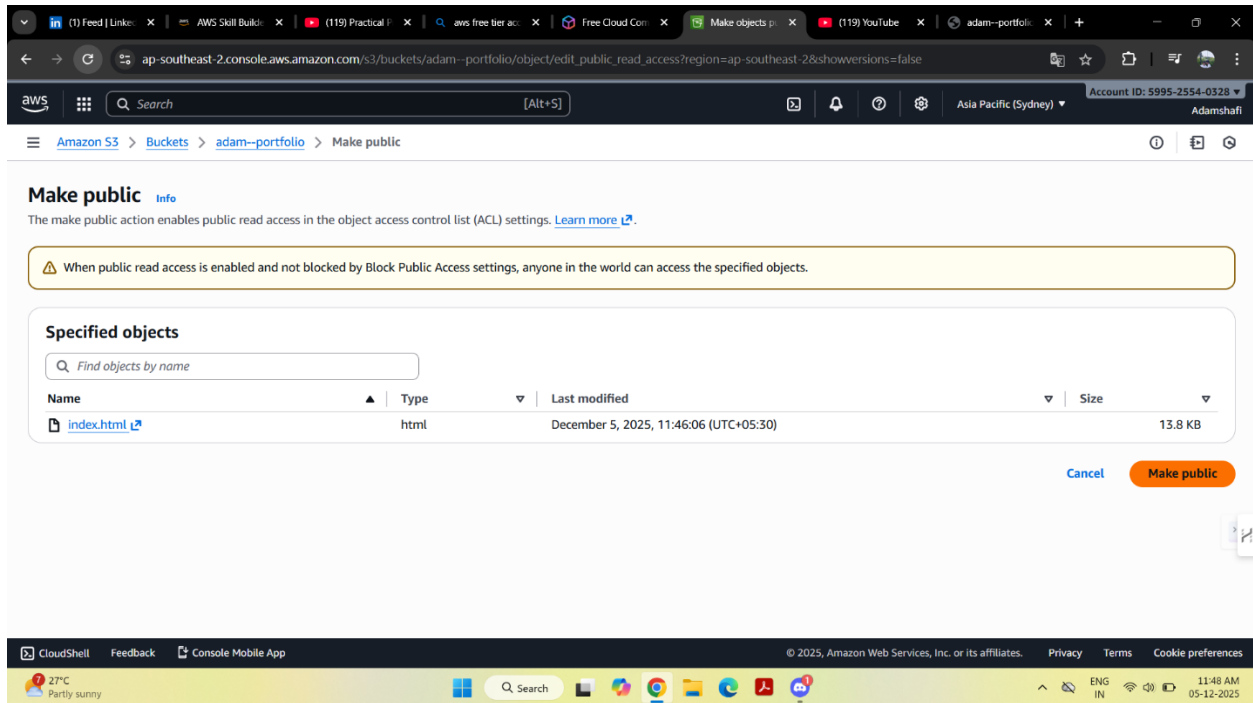

Shows the **Edit static website hosting** page, with the **Enable** option selected and **index.html** specified as the **Index document**.

4. Make the Website Content Public

Action: Made the uploaded objects (the index.html file) publicly readable so users can access the website.

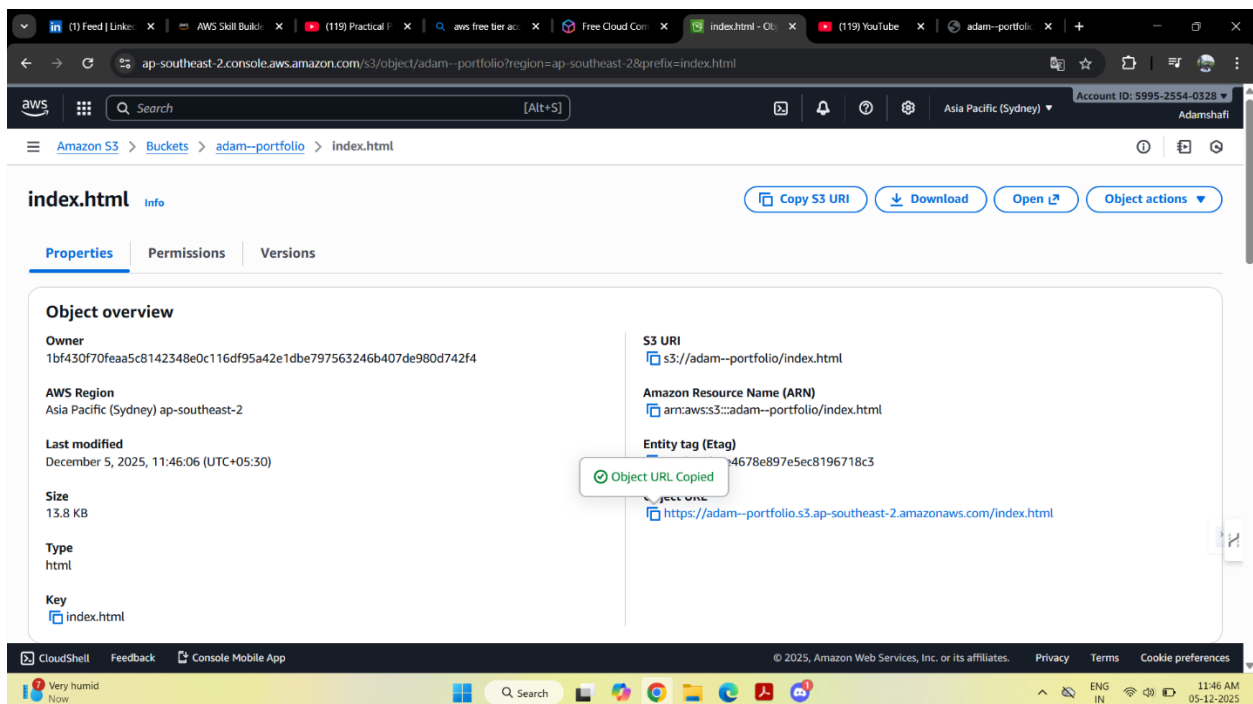

Note: This usually requires setting the bucket policy or disabling Block Public Access.

Shows the "Make public" action being applied to the

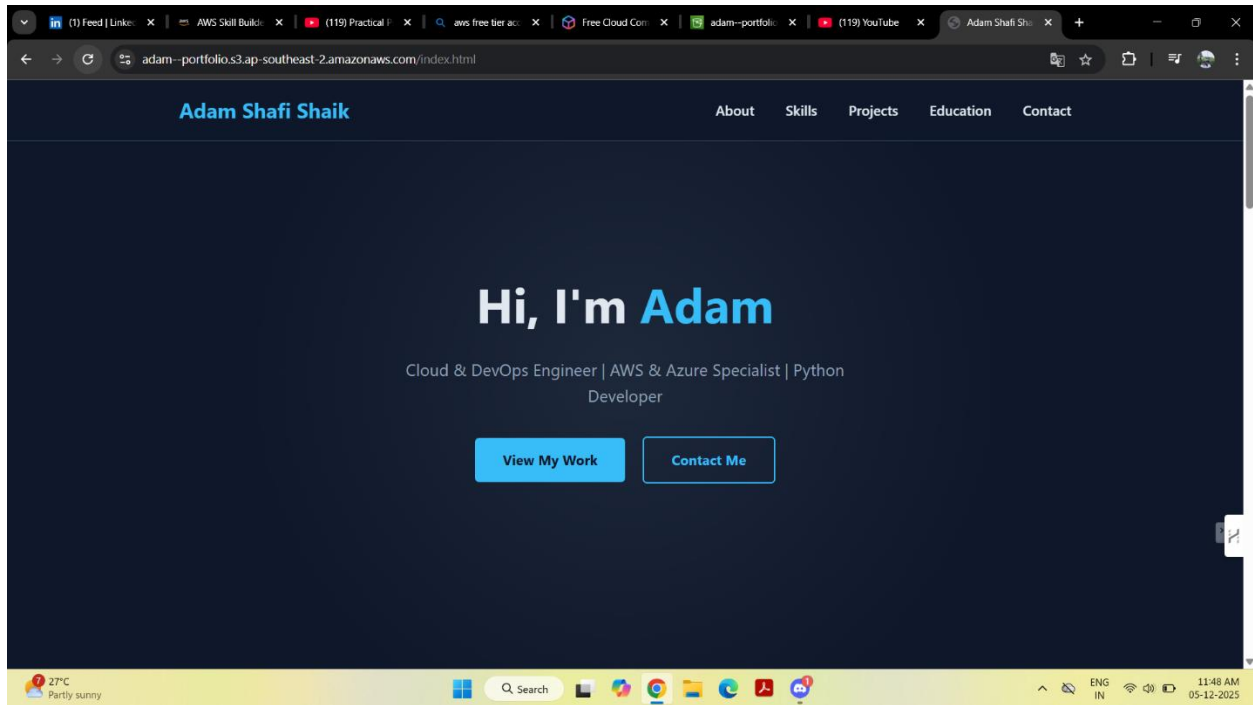

5. Access the Hosted Website

Action: Accessed the website using the generated S3 public endpoint URL.

Shows the S3 console for the index.html object and the Object URL which is the public endpoint for the website (e.g., <https://adam-portfolio.s3.ap-southeast-2.amazonaws.com/index.html>).

Displays the final result: the hosted portfolio website with the title "**Adam Shafi Shaik**" being successfully viewed in the browser using the S3 endpoint.

This project successfully demonstrated the end-to-end process of deploying a static portfolio website using **Amazon Simple Storage Service (S3)**.
